A review of data published in the foreign press
(American, Canadian, etc.) on the simultaneous pro-
duction of phenol and acetone indicates that this
method is valued by the industry as perhaps the most
promising and profitable method for the production of
these products.

A literature search showed that yields up to 85% have been obtained with Cd-salt catalysts. An experimental study of the process via their dipotassium salts established that the optimum conditions are a temperature of 460°C, a reaction period of 1.5 hr, and an initial CO₂ pressure of at least 10 atm. A terephthalic acid yield of 73 or 74% of the theoretical can be obtained.

Results are given of tests to find the effect of clearance
on the vibration of rolling bearings. A method is given
of finding the amount of radial rotor vibration, the
disturbing forces and the frequency spectrum of the
vibration. The theory is based on the assumption that
the rotor of the mechanism is stiff, and there is no
interference in the kinematics of the bearing. (Author)

X-ray films (2X, Agfa Laue, and Agfa Texo) were sensitive to electrons with energies 2 to 40 electron volts. The Agfa Laue film was more sensitive than the others to electrons with energies of 2 to 20 ev. The relation of the densities to the electron energy within the range of 2 to 40 electron volts is shown for the films. Density has a minimum at 12 to 20 ev. When the film is developed in a "sub-surface" developer, a minimum or an inflection point exists; the density depends upon the length of irradiation time at (Materials--Photographic, TT, v. 5, no. 6) (over)
